                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             COMMENT
                                                                                /note="Organ: leaf; Vector: RescueMu (engineered from pBlueScript backbone); Site_1: BamHI; Site_2: BgIII; RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA. Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site, www.zmdb.iastate.edu' and follow the links for RescueMu. Grid H was grown at Berkeley in 2001. DNA was extracted from leaf punches, double digested using BamHI and BgIII, and ligated to form circular plasmids. DHIOB cells were transformed and then screened on LB plates with ampicillin.

/note="Vector: pT773D-pec (Pharmacia) with a modified
polylinker; Site_1: Not I; Site_2: Eco RI: The Ulra-C3
library is a subtracted library of a series, ultimately
derived from a mixture of individually tagged normalized
libraries from rat placenta, adult lung, brain, liver,
kidney, heart, spleen, voary, muscle, and 8, 12 and 18-day
embryos, after a series of subtracted interaction
generated. The following serially subtracted libraries
were generated in this process: Ulr-R-C3, Ul-R-C3,
Ul-R-C0, Ul-R-A1, Ul-R-E1. The tag is a string of 3.5
nucleotides present between the Not I site and the
oligo-dT track whichallows identification of the library
of origin of a clone within themixture. The subtracted
library (Ul-R-C3) was constructed as follows: PCRamplified
clone in serts from Ul-R-C2p clones from which it the Ul-R-C2p library in the form of single-stranded
clrcles. The remaining single-stranded circles (subtracted
library) was purified by hydroxyapatite column
chromatography, converted to double-stranded circles and
electroporated into DH10B bacteria (LifeTechnologies) to
generate the Ul-R-C3 library. This procedure has been
previously described (Bonaldo, Lennon and Soares, Genome
Research 6:791-806, 1996)"

DEFINITION T. brucei sheared genomic DNA clone 157b06, forward sequence,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Constructed at the Institute for Genomic Research (TIGR),
Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanosoma brucei (TREU927/4 GUTAt 10.1) was mechanically sheared
to give a tight size distribution (
4 kb). The v + i method used for the library construction is
described in detail in Smith, H. and Venter, J.C. (Making small
insert libraries for whole genome shotgun sequencing projects. In
Barrell, Oxford University Press, 1999).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hall, N., Bowman, S., Lennard, N.J., Doggett, J., Atkin, R., Chillingworth, C., Ormond, D., Harris, B., El-Sayed, N., Hou, L., Malville, S. E., Rajandream, M.A. and Barrell, B.G. Direct Submission Submitted (10-DEC-2000) Trypanosoma brucei genome sequencing project, Sanger Centre, The Wellcome Trust Genome Campus, Hinxton, Cambridge CB10 1SA, E-mail: barrell@sanger.ac.uk and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Email: nelsayed@tigr.org

Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.ramb.iastate.edu' and follow the links for 'RescueMu.' Grid H was grown at Berkeley in 2001. DNA was extracted from leaf punches, double digested using BamHI and BglII, and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB plates with ampicillin."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      COMMENT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ORIGIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           // Anote="Vector: PWAZIV; Purified genomic DNA from M. musculus C57BIJ/6J (male) was obtained from the Jackson Laboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt endrepaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gil4732114 glp Alz129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xil0-Gold (Stratagene) cells and selected for ampicillin resistance."

DEFINITION 602300576F1 NIH_MGC_87 Homo sapiens cDNA clone IMAGE:4402218 5',
/note=*Organ: Kidney; Vector: pT713D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; 1st strand cDNA was primed with a Not I - oligo(dT) primer, double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT713 vector. mRNA source: 2 pooled kidneys. Library went through one round of normalization. Library constructed by Bento Soares and M. Fatima Bonaldo. " 22 t 1 others
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Homo sapiens

-!- CATALYTIC ACTIVITY: 1-(5-phospho-D-ribosyl)-ATP + diphosphate =
-!- CATALYTIC ACTIVITY: 1-(5-phospho-D-ribose 1-diphosphate.
-!- PATHWAY: FIRST STEP IN HISTIDINE BIOSYNTHETIC PATHWAY. IS VERY IMPORTANT IN THE REGULATION OF HISTIDINE METABOLISM.
-!- SUBUNIT: HOMOHEXAMER (BY SIMILARITY).
-!- SUBCELLULAR LOCATION: CYtoplasmic (By similarity).
-!- SIMILARITY: BELONGS TO THE ATP PHOSPHORIBOSYLTRANSFERASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     SEQUENCE FROM N.A.

Masaki A., Kawabe H., Arimura H., Nakano E., Motai H.;
Cloning and expression in yeast of a cDNA clone encoding Aspergillus
oryzae neutral protease II, a unique metalloprotease.";
Mol. Gen. Genet. 228:97-103(1991).
-! FUNCTION: THERNOSTABLE METALLOPROTEASE. SHOWS HIGH ACTIVITIES ON
BASIC NUCLEAR SUBSTRATES SUCH AS HISTONE AND PROTAMINE.
-! CATALYTIC ACTIVITY: Preferential cleavage of bonds with
hydrophobic residues in Pl'; also 3-Asn-|-Gln-4 and 8-Gln-|-Ser-9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          01-NOV-1995 (Rel. 32, Created)
01-NOV-1995 (Rel. 32, Last sequence update)
01-FBB-1996 (Rel. 33, Last annotation update)
Neutral protease II precursor (EC 3.4.24.39) (Deuterolysin) (NPII).
Aspergillus oryzae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Eukaryota; Fungi; Ascomycota; Pezizomycotina; Eurotiomycetes;

 -I- FUNCTION: COMPONENT OF THE NUCLEOSOME REMODELING FACTOR COMPLEX (NURF), A PROTEIN COMPLEX THAT FACTLITATES THE PERTURBATION OF CHROMATIN STRUCTURE IN VITRO IN AN ATP-DEPENDENT MANNER. THE HYDROLYSIS OF ATP-DURING THE REMODELING OF CHROMATIN IS LIKELY TO BE MEDIATED BY ISWI, RELEASING INORGANIC PHOSPHATE. IT IS ALSO A COMPONENT OF THE ATP-UTILIZING CHROMATIN ASSEMBLY AND REMODELING FACTOR (ACF) AND OF THE CHROMATIN ACCESSIBILITY COMPLEX (CHRAC). THIS SUBBUNIT MAY SERVE AS THE BENERGY-TRANSDUCING COMPONENT OF CHROMATIN ACCESSIBILITY COMPONENT OF CHROMATIN AC
 SUBUNIT: NURF IS COMPOSED OF FOUR SUBUNITS; A 215 kDa PROTEIN, IMITATION SWITCH (15W1), NURF-55, AND NURF-38.
SUBCELLUIAR LOCATION: Nuclear (Potential)
SIMILARITY: BELONGS TO THE SNF2/RAD54 HELICASE FAMILY. SNF2L

ALTERNATIVE PRODUCTS: 5 isoforms; a (shown here), bl, b2, cl and c2; are produced by alternative splicing.

TISSUE SPECIFICITY: Isoform a is widely expressed at similar levels in all tissues examined. Isoforms bl and b2 are predominantly expressed in stomach although they are also detected at lower levels in other tissues. Isoform cl is stomach-specific. Isoform cl is expressed at slightly higher levels in lung and stomach than in other tissues.

SIMILARITY: BELONGS TO THE ANION EXCHANGER FAMILY.

 Am. J. Hum. Genet. 69:635-640(2001).

-1. FUNCTION: RECESSIVE ACTIN-BASED MOTOR. REQUIRED FOR STRUCTURAL INTEGRITY OF INNER EAR HAIR CELLS (BY SIMILARITY).

-1. DISEASE: Defects in MYO6 are the cause of an autosomal dominant form of nonsyndromic sensorineural deafness (DFNA22). The deafness is progressive and postlingual, with onset during childhood (8 to 10 years of age at onset of symptoms; 6 to 8 years of age at onset of first audiometric abnormalities). By the age of approximately sensorineural deafness.

 A set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are
to proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug candidates or pro-drugs -
 Gaps
 The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification.
 generated from the human genome. The complementary pertides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification.

 A set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of the human genome, useful in an assay for screening and identifying of one or more novel peptides which are drug candidates or pro-drugs.
 A set of peptide ligands consisting of specific complementary peptides to proceins encoded by genes of the human genome, useful in an assay for screening and identifying \phi f one or more novel peptides which are drug candidates or pro-drugs -
 Gaps
 generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification.
 Human; complementary peptide; ilgand; drug discovery; drug design.
 The invention relates to a set of complementary peptide ligands

AAR58376-94 show the amino acid sequences of the binding domain of TSAR (Totally Synthetic Affinity Reagents) peptides from the TSAR-9 library. These particular examples bind zinc. The non-variable amino acids at the NH22 and COOH terminals are not shown. TSAR peptides are generated using generic oligonucleotides (see AAA70470-73 for examples). TSARs are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. TASARs or compass. comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal in, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody process.
 TSAR; totally synthetic affinity reagent; synthetic; binding domain; effector domain; concatenated heterofunctional protein; linker; direct; rapid; detection; screening; treatment; zinc binding.
 Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain
 TSAR binding domain encoded by clone ZnlA7, binds zinc.

 AAC97991 to AAC98763 encode the human colon cancer associated proteins, called human colon cancer antigens, given in AAB53234 to AAB54006. The human colon cancer antigens can have cytostatic, cardioactive, muscular; neuroprotective, immunomodulatory, gynaecological, gastrointestinal, vulnerary, nephrotropic, antiinfective and antibacterial activities, and can be used in gene therapy. The colon cancer antigen polynucleotides, proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The polynucleotides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune system disorders, muscular disorders, reproductive disorders, immune system disorders, mulgas, renal disorders, infectious diseases, and cardiovascular disorders, renal disorders, infectious diseases, and cardiovascular disorders, remal disorders, and cardiovascular disorders, remalfication of the present

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.

encode immunogenic polypeptides. The T. gondii nucleic acid molecules, immunogenic proteins and antibodies to the proteins can be used to inhibit T. gondii occyst shedding in a cat due to infection with T. gondii. They can be used for preventing T. gondii infection and for preventing the spread of T. gondii infection. They can also be used for detecting T. gondii infection. The detection method can be used for parasite cysts or occysts in feces, e.g. from enteric apicomplexa occysts such as Cryptosporidium occysts and Toxoplasma occysts.

 The invention relates to detection of parasite occysts or cysts in draces sample comprising confacting the sample with a solid support, drying and then washing the sample with an aqueous wash solution, adding an aqueous elution solution and eluting DNA from the sample by heating and amplifying by PCR occyst/cyst-specific DNA and detecting the amplification products. The method is useful for detecting parasite occysts e.g., enteric apicomplaxa occysts such as Cryptosporidium occysts or Toxoplasma occysts, or for detecting parasite cysts e.g. diardia cocysts. The method is also useful for developing vaccines to prevent immunogenic protein from Toxoplasma gondii.

polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoletic-related diseases, especially cancers and cancer metastases of haematopoletic-derived cells. AAK64703 to AAK87694 represent human immune/haematopoletic antigen genomic sequences from the present invention. AAK54942 to AAK54950 and AAM82169 represent sequences used in the exemplification of the present invention.
 ;
0
 The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

Human brain expressed single exon probe encoded protein SEQ ID NO: 31814
 The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a protein of the invention.
 Isolated nucleic acid molecule encoding a reproductive system antigen is used in preventing, treating or ameliorating a medical condition

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brobes which are derived from genomic sequences expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.

 The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
 Peptide #6585 encoded by probe for measuring placental gene expression.

 Amino acid sequences given in AAMS1210 to AAMS1921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) controlly, and can be used in gene therapy and vaccine production. (I) or proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) capped any be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially cancer metastases of haematopoietic-derived cells. AAK64703 cto AAK87694 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK54942 to AAK54950 and AAMS2169 crepresent sequences used in the exemplification of the present invention.

 The present invention provides the protein and coding sequences of a number of human digestive system antigens. These can be used in the diagnosis, treatment and prevention of digestive system disorders, including cancer, Meckel's diverticulum, bacterial or parasitic infections, appendicitis, Hirschsprung's disease, chronic colltis or ulcerative colltis. The present sequence is a digestive system antigen of

AAY12668, respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. They can also be used to develop products for diagnosis and therapy. They proteins obtained may have cytokine activity, cell profleration/differentiation activity, hamantopiesis regulating activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, receptor/ligand activity, haemostatic and thrombolytic activity, repeptor/ligand activity, antiinflammatory civity, tumour inhibition activity or other activities. The products can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter. Sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into a cell.
 ö
 Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne,

pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis.

P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention of determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO.

The sequence data por Lisequences.

The present invention relates to novel plant transcription factors from Eucalyptus grandis or Pinus radiata. The present sequence is one such transcription factor. The transcription factor may be used to produce a plant having modified gene expression such as a woody plant e.g. a eucalyptus, pine, acacia, poplar, sweetjum, teak, or mahogany species or to modify the activity of a polypeptide in a plant. The transcription factors of the present invention are members from the following families of regulatory proteins: DzIP, bzIP family of G-box binding factors, basic helix loop-helix zipper, homeocluc/homeodomain/homeodox/MADS, homeodomain zipper, LIM domain, AP2 and EREBS, zinc finger domains of type 2

 The present sequence represents a protein of 166 amino acids. The sequence is disclosed as being a protein called BBC6 which regulates cell death through interaction with BC1-2. The DNA may be used for the production of the recombinant protein, which can be used in unspecified therapeutic or diagnostic procedures, as a molecular weight marker, and to raise antibodies that can be used in unspecified diagnostic or therapeutic applications and to reduce or eliminate the biological activity of the BBC6 protein in vivo.

target binding assemblies (TBA) of the invention. These NARS are target binding assemblies (TBA) of the invention. These NARS are selected from NP-kappa-B, SPI, TATA, human papalllomavirus (HPV) E2, HPV ITR, human immunodeficiency virus (HIV) ITR and Tat binding units. This sequence represents a SPI sequence NAR. The TBA is recognised by the carget binding region (TBR) of a probe of the invention. The probe of the invention contains a TBR, a booster binding region (BBR), and an optional support or attachment (OSA). The TBA contains at least one optional support or attachment (OSA). The TBA contains at least one optional sequence, a nuclear localisation signal sequence, an asymmetry sequence, an asymmetry sequence and asymmetry sequences are responsible for the COL and an asymmetry sequence sequence is an optionally an unclear localisation signal sequence, is an optional and association of the NARs. The linker sequence is an object of the NAR function, but provides stability and control over the spacing of the NAR from the rest of the CAB, is an attached support or indicator, or other means of containing a specific target nucleic acid sequence (TNA). The method is highly sensitive, and has a high degree of specificity. The method is highly sensitive, and has a high degree of sequences, including those found in human cells, in HIV, HPV, and other nucleic acid containing systems, including bacteria and viruses.

The invention relates to an isolated polypeptide with improved endoprocease activity relative to subtilisin homologue polypeptide, Savinase (RTM). The invention also relates to an integrated system comprising a computer or computer readable medium comprising a database comprising one or more sequence records. Bach record comprises one or more of haracter string corresponding to a nucleic acid or protein sequence of AAS5599-AAS50728 or AAU3874-AAU38073 respectively. The integrated system comprises a user input interface allowing a user to selectively one or more sequence record. The integrated system is useful for presenting information pertaining to one of several sequence records stored in a database. The method involves determining a list of one or more character strings corresponding to the sequence or its subsequence, and discount of the correcter strings of the list are selected by a user, and discount of the sequence or its subsequence.
 and displaying the selected character strings or aligning the selected character strings or aligning the selected character string. The method further involves displaying an alignment of the selected character string with the additional character string, and displaying the list. The polynucleotides are useful as probes, primers, sense and antisense producing antibodies which homologue polypeptides are useful for producing antibodies which have diagnostic uses related to the activity distribution and expression of subtilisin homologues. The subtilisin homologue polypeptides are used in compositions that serve as cleaning solutions in a wide variety of applications including laundry detergents, contact lens cleansing solutions, and dry cleaning. ANUSHMA-ANUSHS74 represent the amino acid sequences of novel subtilisin homologues of the

The invention relates to an isolated polypeptide with improved endoprotease activity relative to subtilisin homologue polypeptide, Savinase (RTM). The invention also relates to an integrated system comprising a computer or computer readable medium comprising a database comprising a computer or computer readable medium comprising one or more character string corresponding to a nucleic acid or protein sequence of AAS56599.

CAAS56728 or AAN38744-AAN38873 respectively. The integrated system comportises a user input interface allowing a user to selectively come or more sequence record. The integrated system is useful for presenting information pertaining to one of several sequence records stored in a database. The method involves determining a list of one or more character strings corresponding to the sequence or its subsequence determining which character strings of the list are selected by a user, and displaying the selected character strings or aligning the selected character string in the madditional character string, and displaying the list.

CC character string with an additional character string, and displaying the list. The publicities are useful for the selected character string with the additional character string, and displaying the list. The publicities are useful for the producing antibodies which have diagnostic uses related to the activity, distribution and expression of subtilisin homologues. The subtilisin

 The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynuclectides are useful in gene therapy. A composition containing a polypeptide or polynuclectide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as
 Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotextic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
 assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by a canes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveltis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory resence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention of an determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies con devergenties for P. acnes proteins. These antibodies can be used to downrequlate expression and activity of P. acnes polypeptides and cherefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by consyme linked immunosorbent assay (ELISA).
 SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.

 -:- FUNCTION: PROBABLY ACTS AS AN ELECTRON CARRIER.
-:- SUBCELLULAR LOCATION: Integral membrane protein (Probable).
-:- DEVELOPMENTAL STACE: MAXIMUM LEVELS ARE FOUND IN 35 DAY OLD PLANTLETS WHEN THE ROSETTE IS MATURE, CONSISTING OF 8-10 FULLY EXPANDED LEAVES, AND AS THE FLORAL STEM STARTS TO FORM. THIS LEVEL REMAINS CONSTANT DURING THE FURTHER LIFE SPAN OF THE PLANT.
-:- INDUCTION: BY DARK ADAPTATION. THIS GIVES A 20-FOLD INCREASE IN
 Arabidopsis thaliana (Mouse-ear cress).

 S47233 170 bp mRNA linear ROD 08-MAY-1993 flg-fibroblast growth factor receptor FGFR1 [5' region] [mice, MM14 myoblasts, mRNA Partial, 170 nt].
 PAT 08-SEP-2000
 Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalla; Eutheria; Rodentia; Sciurognathi; Muridae; Murinae; Mus. 1 (bases 1 to 170)

Templeton, T.J. and Hauschka, S.D.

For mediated aspects of skeletal muscle growth and differentiation are controlled by a high affinity receptor, FGFR1

Dev. Biol. 154 (1), 169-181 (1992)
 GenBank staff at the National Library of Medicine created this entry [NCBI gibbsq 117204] from the original journal article. This sequence comes from Fig. 5.

 ζ.
 The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin I and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism

The invention relates to an isolated polynucleotide sequence or their complement encoding a polypeptide having a sequence at least 40% complement encoding a polypeptide having a sequence at least 40% identical to DWT (DEMETER, previously known as ATROPCS (ATR)) Domain A, BC or C or their combinations. Also included are an expression cassette comprising the polynucleotide or comprising a heterologous CC cassette comprising the control of a promoter at least 70% identical to DMT & host cell comprising an excogenous polynucleotide encoding a DWT-like protein. The excogenous polynucleotide comprising a polynucleotide encoding a DWT-like protein. The expression cassette is useful for modulating transcription. The method comprising a cross, and selecting a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following corporal activities, which include enhanced expression of the protein into a cell results in a delay in flowering time, introduction of the protein into a cell results in modulation of methylation of the protein in an handled endosperm development and expressing of the protein in a phantical results in explace in expression of the protein in a paradiopsis leaf results in expression of the media feasible and results and paradicipal paradicipal in an paradiopsis leaf results in expression of the media feasible and the protein in a paradicipal paradicipal and paradicipal paradicipal and paradicipal paradicipal and paradicipal paradicipal and paradicipal paradicipal and paradicipal paradicipal and paradicipal paradicipal and paradicipal paradicipal and paradicipal paradicipal and paradicipal parad
 New polynucleotide that control plant development comprising a sequence having a specific homology to DEMETER domains A,B or C
 The polynucleotide is useful for detecting a nucleic acid in a sample. DEMETER is related to 5-methylcytosine glycosylases and regulates transcription of target genes by demethylation. The present sequence represents a PCR primer used to isolate the nucleic acids encoding the DMT-like proteins of the invention.
 Demeter; DWT; Atropos; ATR; 5-methylcytosine glycosylase; ss; DNA demethylation; transgenic plant; transcription modulation; flowering time; endosperm development; MEDEA; PCR primer.

 This invention relates to an ostrich derived growth hormone gene and protein sequences AAC83185 and AAB36000. The invention includes fragments of the growth hormone protein which retain their growth promoting activity. Included in the invention is a recombinant plasmid containing the gene, a method for introducing the gene in to a bird, and a transformed bird produced by the method. The method is used for promoting the growth of an animal. This sequence represents a primer used in the isolation and characterisation of the ostrich growth hormone gene of the
 An ostrich growth hormone polypeptide, a gene and a transformed bird
 PCR primer R1 used in growth hormone gene sequence identification.

 The invention relates to an isolated polynocicotide sequence or their complement encoding a polypeptide having a sequence at least 40% identical to DMT (DEMETER, previously known as ATROPOS (ATR)) Domain A, B or C or their combinations. Also included are an expression or C or their combinations. Also included are an expression of DMT is a complement of a promoter at least 70% identical to DMT of PMT 3' flanking sequence or an 5' untranslated the DMT, a host cell comprising an exogenous polynucleotide encoding a DMT-like protein. The expression cassette is useful for modulating transcription. The expression cassette is useful for modulating transcription. The method comprises introducing the cassette into a host cell preferably Agrobacterium by sexual cross, and selecting a host cell with modulated transcription, where the protein is capable of exhibiting at least one of the following biological activities, which include enhanced expression of the protein in a plant results in a delay in flowering time, introduction of the protein in an Arabidopsis last results in a delay in flowering time, introduction of chromosomal DNA in the cell, reduction of expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. The polynucleotide is useful for detecting a nucleic acid in a sample. The protein in an Arabidopsis leaf results in expression of the MEDEA gene. The polynucleotide is useful for detecting a nucleic acid in a sample. The present sequence represents a PCR primer used to isolate the nucleic acids sequence represents a PCR primer used to isolate the nucleic acids acids encoding the DMT-like proteins, of the invention.
 New polynucleotide that control plant development comprising a sequence having a specific homology to pEMETER domains A,B or C
 invention relates to an isolated polynucleotide sequence or their

Oligonuclectides AAZ36758-76 are derived from the human AHCP (autosomal
 highly conserved protein) gene. The oligonucleotides are useful as probes and primers. The AHCP gene is linked to a genetic predisposition to schizophrenia. The gene is located on chromosome 6p23, between markers D65274 and D65285. Several polymorphisms are found in the AHCP gene. Oligonucleotide probes derived from the AHCP sequences can be used to screen for patients having a genetic predisposition for a neurological or psychological disease, especially schizophrenia. The invention is used to diagnose a genetic predisposition to schizophrenia, and to treat the disorder by gene

 Transgenic non-primate mammal contg. alpha-1,2-fucosyl:transferase of higher primate - expresses H-type antigen and is source of compatible tissue for transplantation into higher primate
 The present sequence is a primer for the PCR amplification of fragment B of the mouse alpha-1,3-galactosyltransferase (GT) gene, which was used in the construction of the plasmid pGT/FT-2. pGT/FT-2, which contains the marine GT and human alpha-1,2-fucosyltransferase genes, was injected into the fertilised ova of a non-primate mammal, e.g. a pig. Tissues from the resultant transgenic mammals, which contain the human sugar transferase gene and express a H-type antigen, can be transplanted into a human without inducing hyperacute rejection.

 THE STATE OF THE S
 This sequence represents a PCR primer for the mouse phosphoglucokinase (PGK) gene. The invention relates to a process for the preparation of transgenic animals, that comprises: (1) introduction of a foreign gene into foetal cells; (2) screening of the recombinant cells from the foetal cells; (3) injection of the screened recombinant cells into fertilised eggs; and (4) transplantation of the injected fertilised eggs into the uterus of pseudopregnant female animals. The method is used to prepare homologous recombinant transgenic animals.

polypeptide and an anti-CCP antibody is useful for detecting the presence of CCP in a sample. A CCP modulator is useful for modulating the cell cycle or growth of a plant such as Arabidopsis thaliana, rice, wheat, maize, tomato, alfalfa, oilseed rape, soybean, sunflower and canola. CCP nucleic acid and polypeptide molecules are useful as modulating agents in regulating cell cycle progression in plants. CCP is useful to treat disorders characterised by Insufficient or excessive production of CCP protein or production of CCP protein forms which have decreased or aberrant activity. Compounds that bind to or modulate the activity of CCP polypeptide are useful as merbicides or plant growth regulators. The polynucleotide is useful for modifying cell fate, plant development, plant morphology, blochemistry and/or physiology, the length of the G1, S, G2 and/or M phase of the cell division, DNA replication, promotion, stimulation or enhancement of cell division, DNA replication, seed set, seed development, tuber, frutt, last formation, shoot and root initiation and/or development, module function, dwarfism in plants, senescence, tolerance or resistance to stress. CCP, the polynucleotide cand the anti-CCP antibody are useful in agriculture to modulate the protein levels or activity of a protein in involved in the cell cycle due to environmental conditions, including abiotic stress such as pathogen attack, drought, salt stress, or biotic stress such as pathogen attack, drought, salt stress, or biotic stress such as pathogen attack, drought, salt stress, or biotic stress such as pathogen attack, drought, salt stress, or biotic stress such as pathogen attack, drought, salt stress, or biotic stress such as manunogen to generate antibodies. CCP protein is useful to sorge the modulate CPP protein in a CCP protein is a general suseful for expressing CCP protein, to detect CCP mind a general squence or protein or modulate core or the physical squence or the hyperimer used to isolate a nucleic activity. expression vector, where the vector encodes transfer RNAs (tRNAs) that recognise rare codons, and where the host cell expresses at least a fragment of at least one clostridial protein. The host cells are useful for the overproduction of clostridial protein. These proteins and toxins are useful in medical and veterinary applications, including vaccine production, as well as treatment of neurological and other diseases and consequence contain codons specific for amino acids which are rarely used in E. coli. To overcome the expression problems caused by clostridial genes in E. coli, the invention provides host cells with overexpressed cognate tRNAs for rarely used codons. The growth of the host cells is unfulibited by expression of the tRNAs. Production of at least 2 times more clostridial protein in E. coli cells which
 co-express the tRNA genes as compared to E. coli cells which do not express the tRNA genes is achieved. The methods also avoid the need for an anaerobic environment for growth, permitting large-scale development of antisera, vaccines and toxoids. The present sequence represents a PCR primer for a Clostridium botulinum toxin, which is used in an

 Probe;
 The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The invention provides a novel method of domain specific gene evolution (DSGE) of a target nucleic acid encoding an amino acid of interest, that comprises providing pairs of substantially complementary single-stranded targeting polynucleotides (TPs). The pairs comprise a homology clamp substantially corresponding to r substantially complementary to a predetermined sequence of T encoding a domain of A, the pairs comprising a library of mismatches between the TPs and the sequence and a library of comm a library of altered Ts. The methods can be used in the creation of transgenic organisms, and animal and plant models of the creation of transgenic organisms, and animal and plant models of disease. Domain targeting can also be used in cells or animals that are diseases or altered, e.g. to identify reversion genes. The methods may hich are expressed to produce ilibraries of altered proteins, which can then be screened for useful proteins. The methods are useful to identify new members of gene families which may be useful in functional genomics studies, as well as identification of new drug targets. The invention provides an efficient method of DSGE that generates maximal diversity and increases the probability of identifying agene of interest. The methods also avoid multiple subcloining steps. Sequences AA290616-621 represent TPs for evolving CDE region of scry to botulinum neurotoxin.

The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intext 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures.

 Sequences AAA31040-A32093 represent novel plant microsatellite sequences and associated flanking species. The sequences comprise a central core repeat sequence, especially selected from the sequences AAA32094-A32096 with left and right flanking sequences. The polynucleotide sequences can be used in the detection of DNA polymorphisms, in genome mapping, in physical mapping, in positional cloning of genes, in variety identification and in evaluation of genetic variability within and between plant tissues, populations, cultivars, species and species groups. They may also be used to design hybridization probes for oligonucleotide fingerprinting and library screening and to design primers for microsatellite-primed PCR. Microsatellite markers are useful to locate specific economically useful genes in plant genomes.

 measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the
 Single exon nucleic acid probes for analyzing gene expression in human brains -

The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
 The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for

 The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present isequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mENAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. S' ESTs are derived from mRNAs with intext 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures.
producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.

(I) and (II) can be used in gene therapy and vaccine production. (I) and (II) may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate colon tumour associated protein (TCAP) expression, such as colonic cancer. For example, (I) and (II) may be used to treat disorders associated vith decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of TCAPs by expressing inactive proteins or to supplement the produce the TCAP proteins, by inserting the nucleic acids into a host complementary sequences may also be used as DNA probes in diagnostic polymerase chain reaction (PCR) and hybridisation assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. (I) may also be used as antigens in the production of antibodies against TCAPs and in assays to identify modulators of TCAP expression and activity. TCAP expression and activity. The anti-(I) antibodies may also be used as altitodies and antagonists may also be used controlled to a production of antibodies may also be used as adiagnostic or as diagnostic and in assays to identify modulators of TCAP expression and activity.
 (e.g. by enzyme linked immunos/rbant assay (ELISA)). AAI28460 to AAI29512 and AAM24494 to AAM24523 represent nucleotide and amino acid sequences given in the exemplification of the present invention.
 present invention describes colon tumour associated proteins (I) and
 Colon tumor associated proteins and nucleic acids useful for the prevention, diagnosis and treatment of colonic cancer

The present invention provides the protein and coding sequences of a mumber of ovarian and breast antigens. These are shown in AAI62467-AAI62572 and AAW42240-AAW42345. The sequences can be used in the diagnosis, prevention and treatment of breast and ovarian cancers, and their metastases. The present sequence is a genomic sequence of the
 invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

 amino acid sequences given in AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) cupplement the patients own production of (I). Additionally, (I) cupplement the patients own production of (I). Additionally, (I) cupplement the patients own production of (I). Additionally, (I) cupplement the patients own production of (I). Additionally, (I) cupplement the patients of produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polyvucleotides may be used to prevent, diagnose and treat immune/haematopoietic-derived cells. AAK64703 to AAK87694 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK54912 to AAK84950 and AAM82169 represent sequences used in the exemplification of the present invention.
 expressed sequence tag; secreted protein; cDNA isolation;
 to AAK64702 encode the human immune/haematopoietic antigen (I)
 New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures

The present sequence is one of a large number of 5' ESTS derived from mRNAs encoding secreted proteins. An ORF has been identified within the sequence. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond aminly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed CDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain questream regulatory sequences and to design expression and secretion
 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
 The invention relates to an isolated nucleic acid detection reagent

capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL36511), expressed DNA sequences (ABL01840-ABL36511), and the encoded proteins (ABB57737-ABB72072).

New polynucleotides and polypeptides for diagnosing, treating, preventing or prognosing e.g. diseases or disorders of the nervous, musculoskeletal, excretory, gastrointestinal, reproductive, and

Claim 1; SEQ ID No 581; 642pp; English.

The invention relates to novel nucleic acids encoding novel human foetal antigens. The nucleic acids and proteins are used to prevent, treat (e.g. by gene therapy) or amaliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They mice, are also used in diagnosing a pathological condition or susceptibility to a pathological condition. The antibodies to the antigens can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoasays e.g. radioimmunoassays or enzyme linked immunosorbent assays (ELISA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, when the hyperproliferative disorders e.g. neophasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders

```
e.g. cerebral ischaemia, angiogenesis, nervous system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage espabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. Numerous examples of diseases and disorders treated by the nucleic acids and proteins are given in the specification. The present sequence
 A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences given in AAT19001-T20637 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3 "directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3"-end of mRNA by using poly(T) as the sole primer. Since the 3"-
 Identifying gene signatures in 3'-directed human cDNA library - e.g. for diagnosis of abnormal cell function, by preparing cDNA that reflects relative abundance of corresp. mRNA in specific human

405 Lexington Avenue, 64th Floor
 Sequence 11, Application US/09143634
Patent No. 6214602
GENERAL INFORMATION:
APPLICANT: Zdanovsky, Alexey G.
TITLE OF INVENTION: EXPRESSION OF CLOSTRIDIAL TOXINS AND PROTEINS
FILE REFERENCE: PRMG-03193
CURRENT APPLICATION NUMBER: US/09/143,634
CURRENT FILING DATE: 1998-08-28
NUMBER OF SEQ ID NOS: 28
SOFTWARE: Patentin Ver. 2.0

 noticing of the institute for Genomic Research (TIGR),
Constructed at the Institute for Genomic Research (TIGR),
Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanosoma brucei (TREU9774 GUTat 10.1) was mechanically sheared
to give a tight size distribution (
4 kb). The v+ i method used for the library construction is
described in detail in Smith, H and Venter, J.C. (Making small
insert libraries for whole genome shotgun sequencing projects. In
Genome Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barrell, Oxford University Press, 1999).
Email: nelsayed@tigr.org
Details of T. Drucei sequencing at the Sanger Centre are available
at http://www.sanger.ac.uk/Projects/T_brucei/
 TA62A10Q 23 bp DNA linear GSS 13-DEC-2000 T. brucei sheared genomic DNA clone 62a10, reverse sequence, genomic survey sequence.
 EST 06-JUN-1997
 Trypanosoma.

Constructed at the Institute for Genomic Research (TIGR),
Rockville, MD. Genomic DNA isolated from a cloned population of
Trypanosoma brucei (TREU9274 GUTPAT 10.1) was mechanically sheared
to give a tight size distribution (
4 kb). The v+i method used for the library construction is
described in detail in Smith, H. and Venter, J.C. (Making smal)
insert libraries for whole genome shotgun sequencing projects. In
Genome Sequencing: A Practical Approach, eds. M. Vaudin and B.
Barrell, Oxford University Press, 1999).
Email: nelsayedtigr.org
Details of T. brucei sequencing at the Sanger Centre are available
at http://www.sanger.ac.uk/Projects/T_brucei/.

 SOURCE
 (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMD42 (gil4732114 [qp]ARD2072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

ECORI; CDNA made by oligo-dT prining. Directionally
cloned into EcoRI/XhoI sites using the following 5'
adaptor: GGCACGAG(G). Library constructed by Ling Hong
in the laboratory of Gerald M. Rubin (University of
California, Berkeley) using ZAP-CDNA synthesis kit
(Stratagene) and Superscript II RT (Life Technologies)."
a 5'-end-enriched cDNA library. Gene 200 (1-2), 149-156 (1997)
This clone was obtained from a 'full length-enriched' cDNA library
constructed by 'Oligo-Capping' method. The coding region starts
from the 50 bp upstream for the 3'-end.

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gil4732114[gb]AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and

Anote—"Vector: Lambda ZAP; Site_1: EcoRI; Site_2: XhoI; Toxoplasma RH strain tachyzoites were grown in human foreskin fibroblast cultures in vitro. The library was constructed by K.L. Wan, Cambridge University. CDNAs were synthesized from polyA RNAs by oligo d(T) priming and directionally cloned into the EcoRI to XhoI sites of the Lambda ZapII vector using the ZAP-CDNA synthesis kit (Stratagene). WARNING: the library contains a small percentage of CDNAs derived from the human host cells."
